

**Discussion 11**

Fall 2023

**1. CTMC Introduction**

Consider the continuous-time Markov chain defined on the state space  $\{1, 2, 3, 4\}$  which has transition rate matrix

$$Q = \begin{bmatrix} -3 & 1 & 1 & 1 \\ 0 & -3 & 2 & 1 \\ 1 & 2 & -4 & 1 \\ 0 & 0 & 1 & -1 \end{bmatrix}.$$

- Find the stationary distribution  $\pi$  of this chain.
- Find the stationary distribution  $\mu$  of the jump chain, the DTMC which only keeps track of the jumps. Formally, if  $(X_t)_{t \geq 0}$  transitions at times  $T_1, T_2, \dots$ , then its jump chain is  $(Y_n)_{n=1}^\infty$ , where  $Y_n := X_{T_n}$ .
- Suppose the chain starts in state 1. What is the expected amount of time until it changes state for the first time?
- From state 1, what is the expected amount of time until the chain is in state 4?

## 2. Frogs

Three frogs are playing near a pond. When they are in the sun, they get too hot and jump in the lake at rate 1. When they are in the lake, they get too cold and jump onto land at rate 2. The rates here refer to those of the Exponential distribution. Let  $X_t$  be the number of frogs in the sun at time  $t \geq 0$ .

- a. Find the stationary distribution of  $(X_t)_{t \geq 0}$ .
- b. Find the answer to part a again, this time using the observation that the three frogs are independent two-state Markov chains.

### 3. Lazy Server

Customers arrive at a queue at the times of a Poisson process with rate  $\lambda$ . The queue is in a service facility with infinite capacity, in which there is an infinitely powerful but lazy server who visits the facility at the times of a Poisson process with rate  $\mu$ . These two processes are independent. When the server visits the facility, it instantaneously serves all the customers in the queue, then immediately leaves. In other words, at any time, the only customers waiting in the queue are those who arrived after the server's most recent visit.

- a. Model the queue length as a CTMC, and find its stationary distribution.
- b. Supposing that the CTMC is at stationarity, find the mean number of customers waiting in the queue at any given time.
